Slit tape woven geotextiles comprise woven flat tapes, cut/ slit from a polypropylene sheet. These films are not extruded and prestressed, and consequently have lower strength properties than the monofilament geotextiles.

Owing to close overlapping and weaving of slit films/ tapes, in comparison to rounded threads/ strands (as in woven geotextile), these geotextiles are typically suitable for applications where drainage and filtration and clogging of the geotextile pores are less of a concern. They provide a relatively economic alternative (to the monofilament woven geotextiles) for stabilization and separation applications
